DAY 16 ASSIGNMENT

Simple Admin Portal

Student Name	Larbi Peniels Okyerewa	Date	9/28/2026
Week	Week 4 - Administration	Day	16
Technology	React + Material UI	Backend	Node.js + SQL Server

Test	Expected Result	Pass
Login as Admin	Redirected to Admin portal	☒
Open Admin dashboard	Statistics and recent records display	☒
Open Users	System users display	☒
Disable test user	Status changes to Inactive	☒
Login as disabled user	Login rejected	☒
Re-enable test user	Status changes to Active	☒
Open Jobs	Jobs from multiple companies display	☒
Close test job	Job status changes to Closed	☒
Browse jobs as Job Seeker	Closed job is not shown as active	☒
Open Applications	System-wide applications display	☒
Job Seeker opens /admin	Access denied/redirected	☒
Employer opens /admin	Access denied/redirected	☒
Job Seeker token calls Admin API	403 Forbidden	☒
Admin token calls Admin API	200 OK	☒
Stop backend	Friendly error state displayed	☒

Understanding Questions

What is the difference between authentication and authorization?

Answer: Authentication is used to verify who a user is while authorization is used to check what the user is allowed to do.

Why is React ProtectedRoute not enough to secure the Admin portal?

Answer: React ProtectedRoute is used to protect only the frontend. A user could bypass the react interface and directly send requests to the backend.

Why must Admin API endpoints also check authorizeRoles('Admin')?

Answer: Admin API endpoint contains sensitive operations. So checking ensures that only the admin can perform those operations.

What is the difference between HTTP 401 and HTTP 403?

Answer: HTTP **401** means the request does not have valid authentication credentials whiles HTTP **403** means the user has been successfully authenticated, but they do not have permission to access the requested resource

What are result.recordset and result.recordsets in the mssql package?

Answer: result.recordset contains the first result set returned by a SQL query or stored procedure whiles result.recordsets contains **all result sets** returned by the query or stored procedure.

Why might an Admin dashboard stored procedure return multiple result sets?

Answer: An Admin dashboard may need different types of information at the same time, such as dashboard statistics, recent users, and recent jobs. Returning these as multiple result sets allows the backend to retrieve all the required dashboard data with one database call.

Why should PasswordHash never be returned by the API?

Answer: A password hash is sensitive authentication information and should remain on the server.

Why should a confirmation dialog be used before disabling a user or closing a job?

Answer: It provides an additional safety step before performing an irreversible or significant action.

What is the authorization difference between an Employer closing a job and an Admin closing a job?

Answer: An employer can only delete a job belonging to his or her own company but an admin can close jobs across the system.

Why should Admin only monitor application statuses in this exercise instead of changing them?

Answer: Cause an admin doesn't have the right to handle applications.
