

CareerBridge – Employer Dashboard Assignment

1. Completed Work

The Employer Dashboard functionality for CareerBridge has been completed.

The following features were implemented:

- Employer Dashboard displaying company information, total jobs, open jobs and total applications.
- Post Job form with job title, description, location, job type, category and application deadline.
- Validation for required fields and application deadlines.
- My Job Postings page showing jobs belonging to the authenticated employer.
- Applicant list for each employer's job.
- Applicant information including name, contact information, CV details, application status, skills, education and cover letter.
- Applicant profile page.
- Job closing functionality.
- Authentication and authorization to ensure employers can only manage their own jobs and applicants.
- Frontend and backend API integration.
- SQL Server stored procedures for employer dashboard statistics, job creation, employer job listings, applicant retrieval and closing jobs.

2. Difficulties Encountered

One of the main difficulties was connecting the frontend, Node.js/Express backend and SQL Server database correctly.

Another challenge was implementing authentication and authorization so that the employer's company is determined from the logged-in user instead of allowing the frontend to provide a company ID.

Debugging the applicant and CV functionality also required checking the relationships between the User, JobSeeker, CV, Application, Job and Company tables.

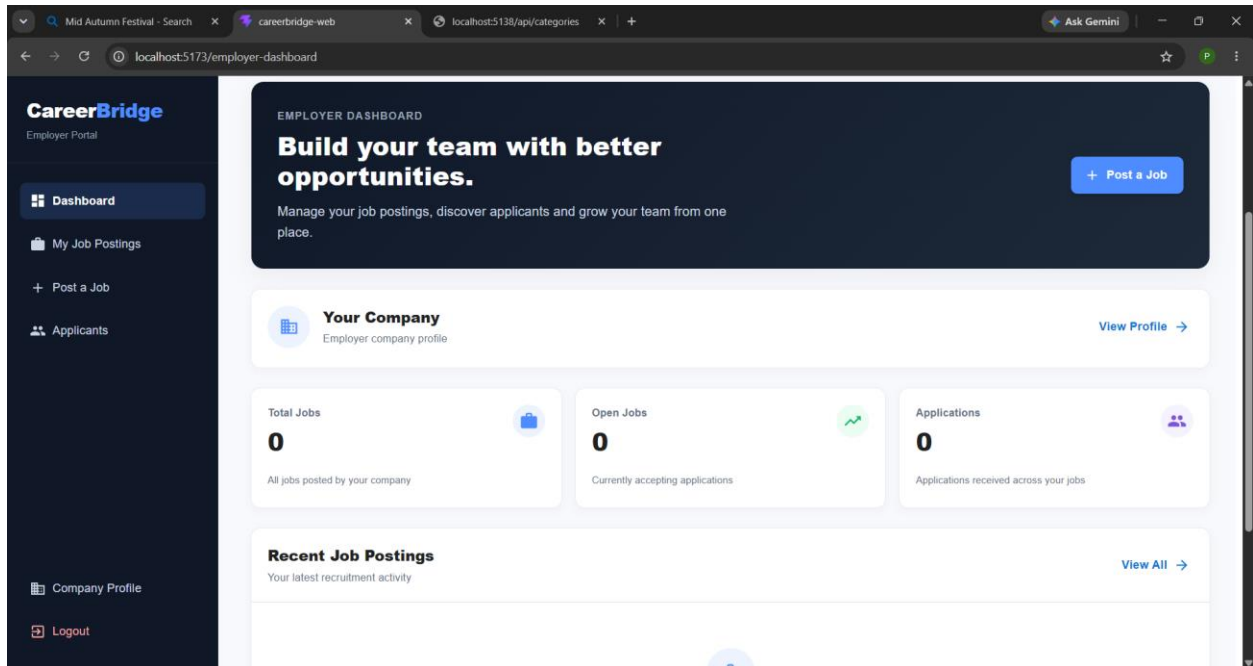

Some Material UI warnings also appeared during development and had to be corrected.

3. Items Not Yet Working

The main Employer Dashboard functionality is working, including job posting, viewing employer jobs, viewing applicants and closing jobs.

4. Evidence

1. Employer Dashboard

2. Successful Job Posting
